Framework

- Rationale in medical genetics
- Tool I: Registry - Epidemiology - Database
- Tool II: Definitions and Nosology
- Tool III: Distinct approaches
    - Dysmorphology
    - Syndromology

Rationale in medical genetic

Clinical geneticist seeks a consistent approach
to lead to the diagnosis in a patient with birth defect

Aims diagnostic assessment
more precise delineation on natural history
follow-up and prognosis
open to precise genetic counselling

- Evidence derived from

Embryology: chronologic and stepwise mechanisms leading to ab-/normal development

Epidemiology/Population Genetics

Animal models

Bioinformatics prediction

Registries and Databases

Tool I - Congenital Anomalies Registry

Specific public health problem indicators **EUROCAT**

European network for the surveillance of **c**ongenital **a**nomalies *tribute to Professor Yves Gillerot*

Central Registry – Project Management Committee
Reliable, Available and Comparable on quantitative or qualitative parameters - Dataset Registries

Tool I - Congenital Anomalies (CA) Registry

The Objectives of EUROCAT

- provide **essential epidemiologic information on CA** in Europe
- facilitate the early warning of new teratogenic exposures
- **evaluate the effectiveness of primary prevention**
- **assess** the **impact of developments in prenatal screening**

-act as an **information and resource center** for the population health professionals and managers regarding clusters or exposures or risk factors of concern

-**provide a ready collaborative network** and infrastructure for research related to the **causes and prevention of congenital anomalies** and the treatment and care of affected children

- act as a catalyst for the setting up of registries throughout Europe collecting comparable and standardised data

European Monitoring of Congenital Anomalies: JRC-EUROCAT Report on Statistical Monitoring of Congenital Anomalies (2008 - 2017)

Abstract: Worldwide, congenital anomalies are a leading cause of fetal death, infant mortality and morbidity in childhood. According to the EUROCAT estimates, of the 5.1 million births in the European Union (EU) each year approximately 127,000 (2.5%) have a congenital anomaly. EUROCAT is a European network of population-based registries whose objectives are to provide essential epidemiologic information on congenital anomalies in Europe, to facilitate the early warning of new teratogenic exposures and to evaluate the effectiveness of primary prevention. Each year, EUROCAT performs statistical monitoring for both trends and clusters in time on 84 anomaly subgroups. The results of the statistical monitoring are the basis for instigating possible further investigations at the local registry level. The present report shows the results of the monitoring performed on data for the birth years 2008-2017 by the JRC-EUROCAT Central Registry. Cases of congenital anomaly among livebirths, fetal deaths from 20 weeks gestational age and terminations of pregnancy for fetal anomaly following prenatal diagnosis at any gestational age were included. We report both the statistical results and, where available, the outcome of the preliminary investigations conducted by registries.

Tool I - Congenital Anomalies Registry(ct'd)

Networks of action for 'Rare diseases'*

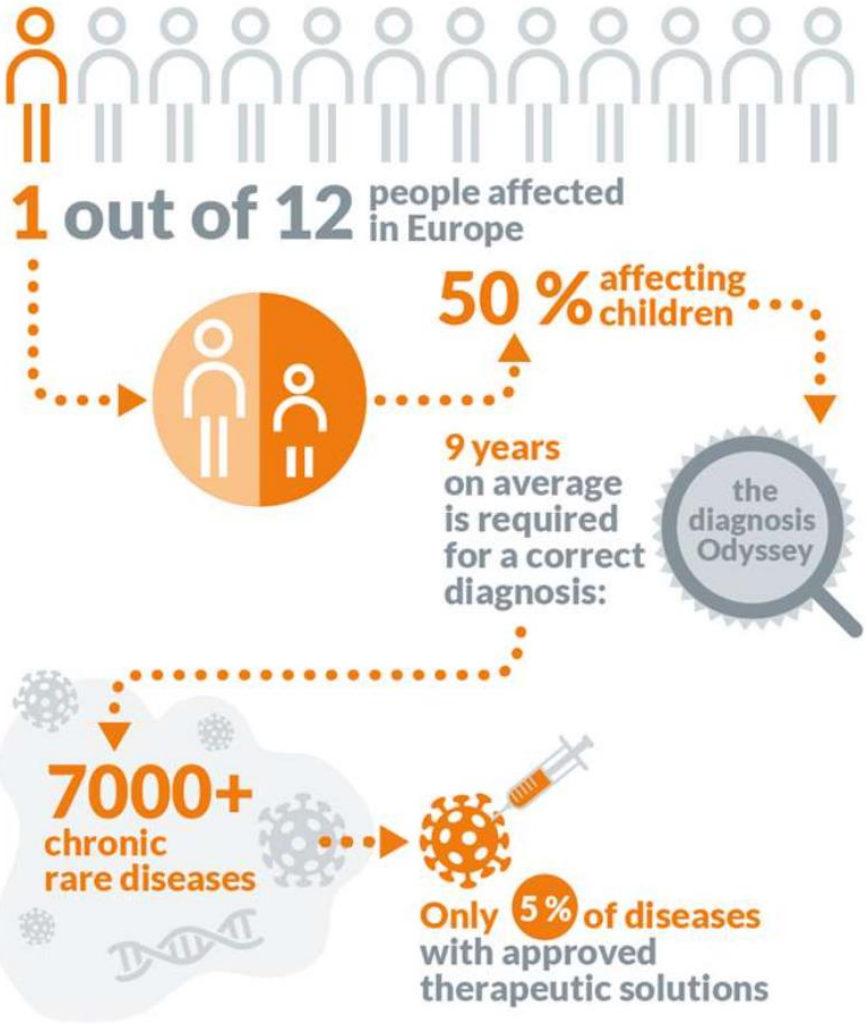
- have been supported under the Program for Community Action on Rare Diseases in 1999-2003; the EU Public Health Program 2003-2007 and the second EU Health Program 2008-2013

**** Rare diseases define conditions with a prevalence <1/2.000 livebirths***

The aims

- **improve exchange of information** via existing European networks
- **promote better classification**, develop strategies and mechanisms for exchanging information between people affected by a rare disease volunteers and professionals
- **define relevant health indicators**
- **develop comparable epidemiologic data at EU level**
- **support and exchange of best practice -** develop measures for patient groups
- network and infrastructure for research into the causes and prevention of congenital anomalies and treatment/ care of affected children
- survey policies and practices with regard to periconceptional folic acid supplementation

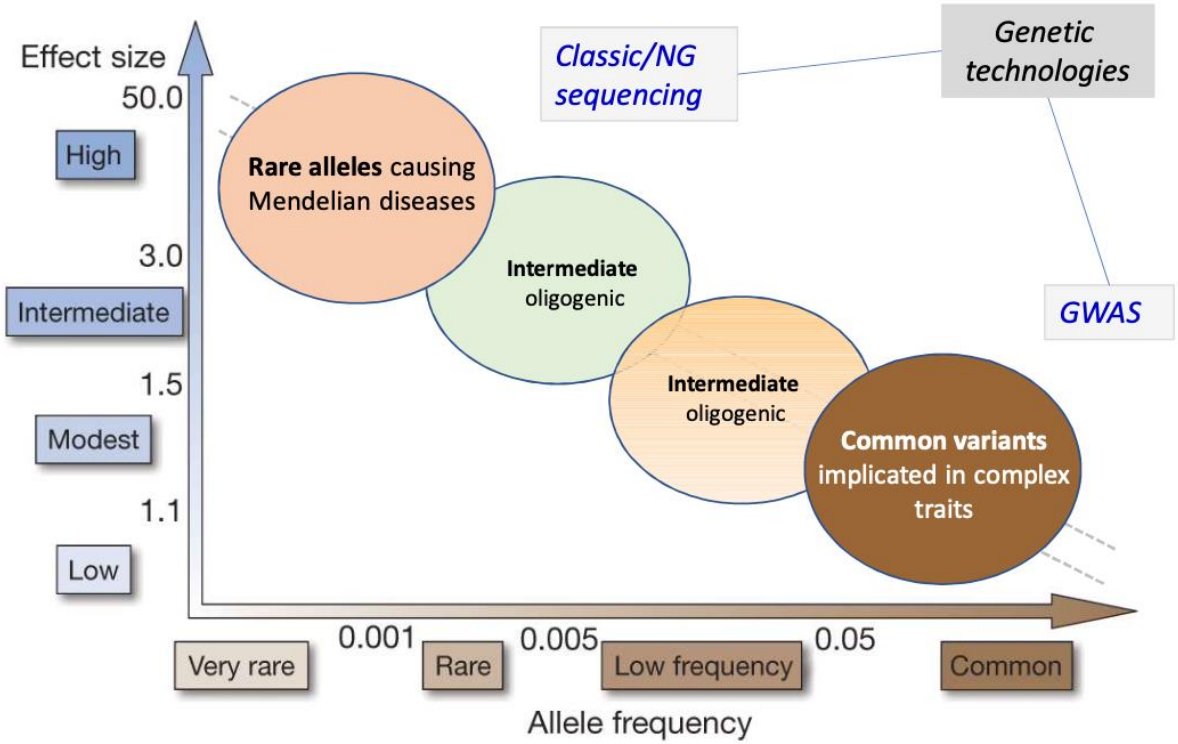
Rare diseases - definition



Rare diseases impact

- >80% with genetic origin
- Early onset , lifelong burden
- Difficult to diagnose and treat
- Often multisystemic – alter QOL
- Impact on social environment
- Fragmented support and research

Rare diseases - basics



Manolio et al. Nature 461, 2009

Rare diseases – not limited to a concept

Tool I - Congenital Anomalies Registry (ct'd)

Networks of action *for Rare diseases*

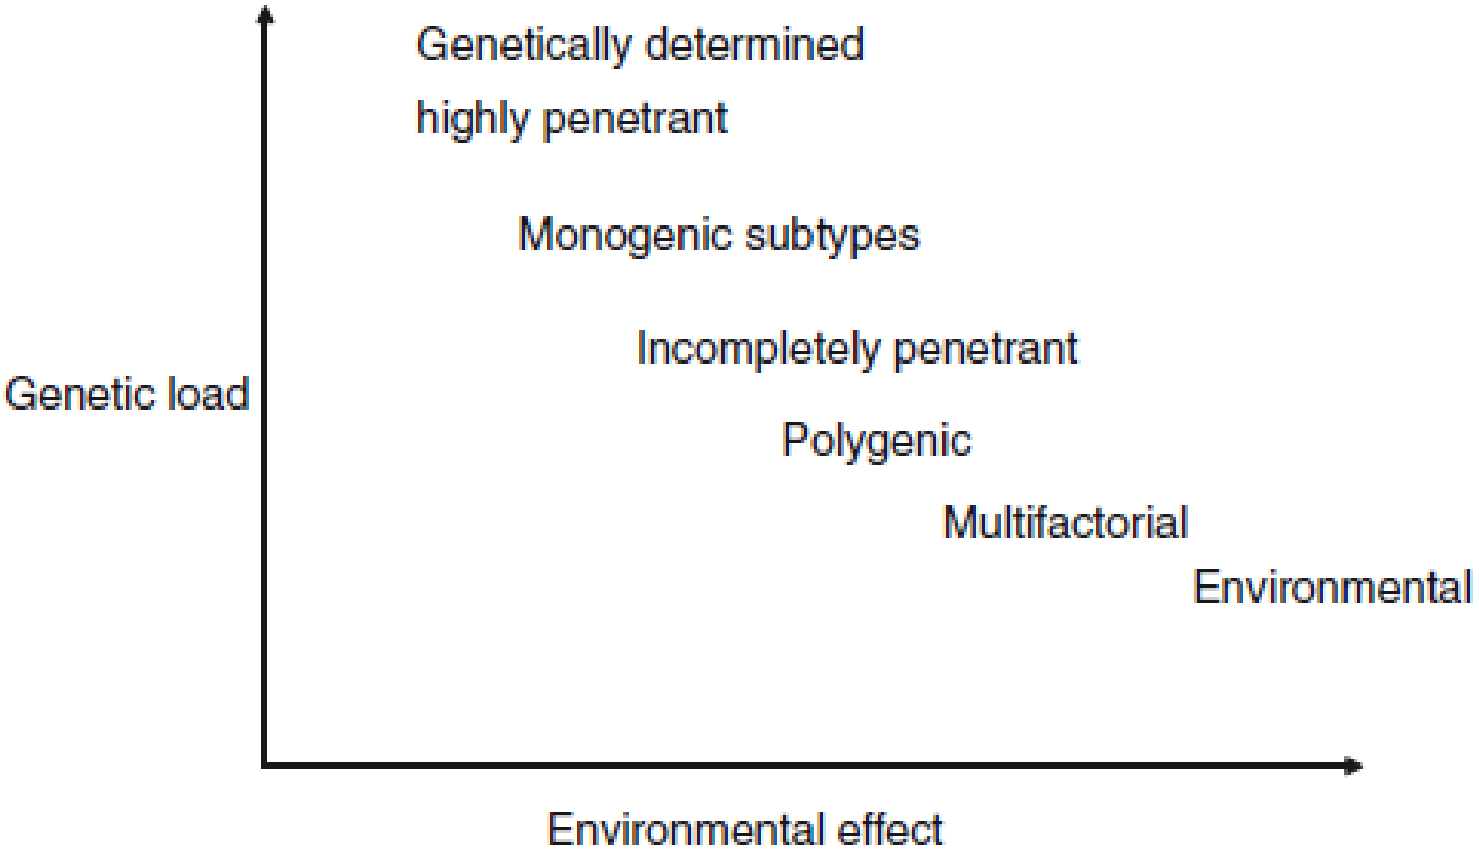
- **The EU EUROCAT project** - surveillance of congenital anomalies in Europe is coordinated by the University of Ulster Northern Ireland

- European network of **51 registries in 28 countries**

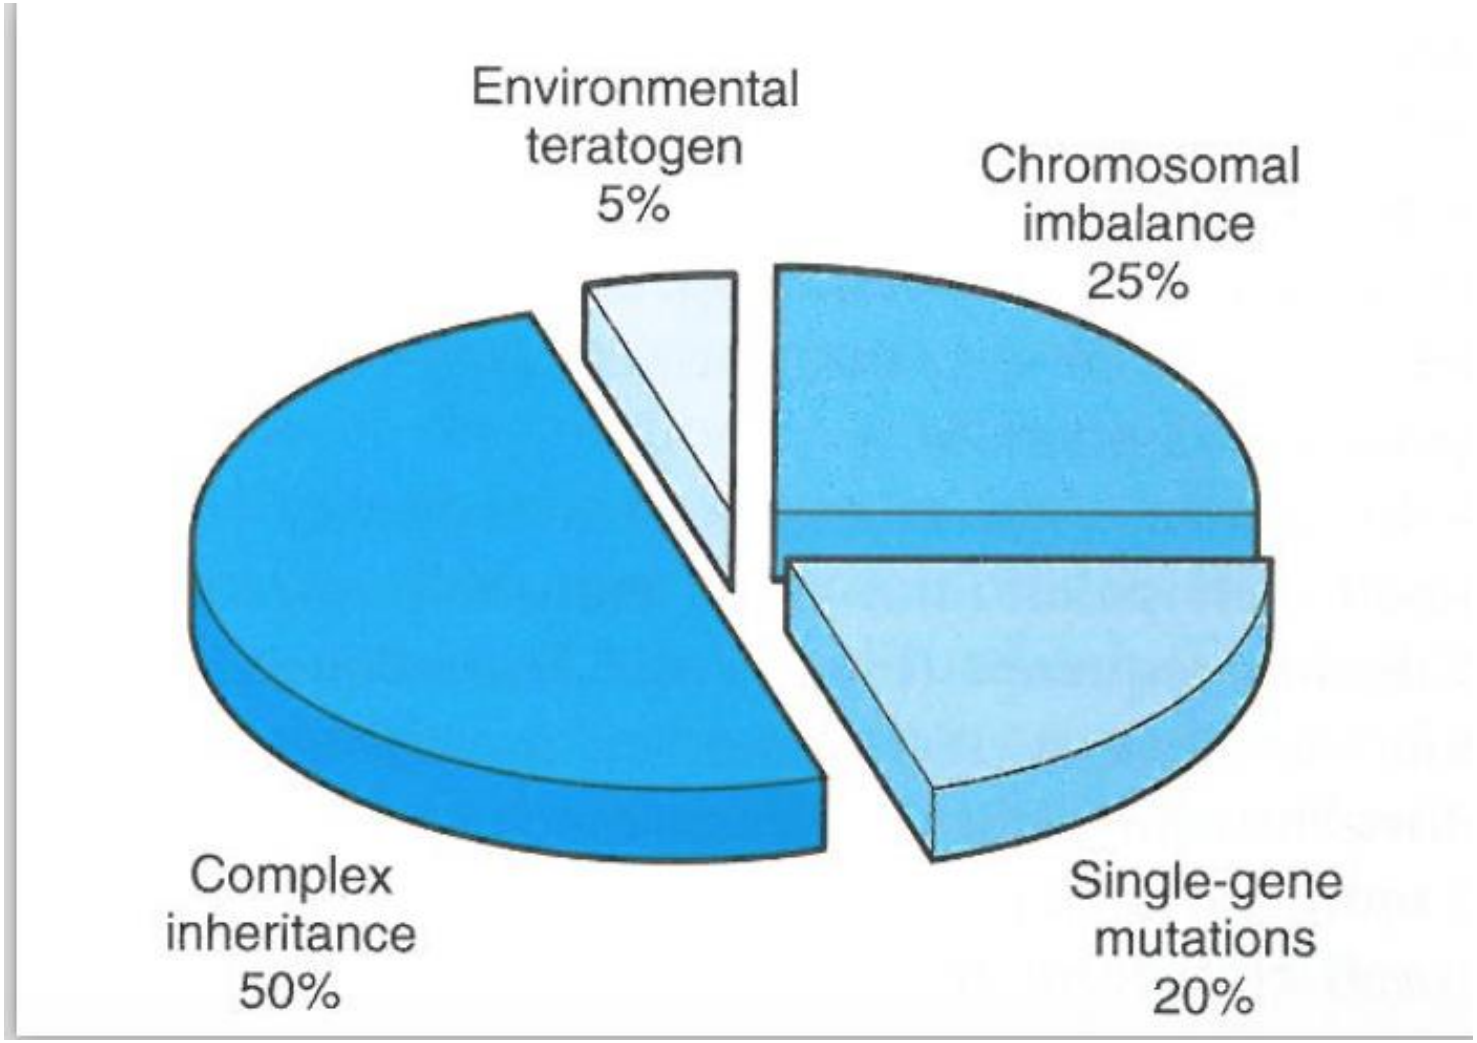
- > 1 million births/year in Europe are surveyed

Birth defect - congenital anomaly

- **Prevalence – 3%**



Birth defect – 'main categories'



Tool II - Birth defect - Nosology

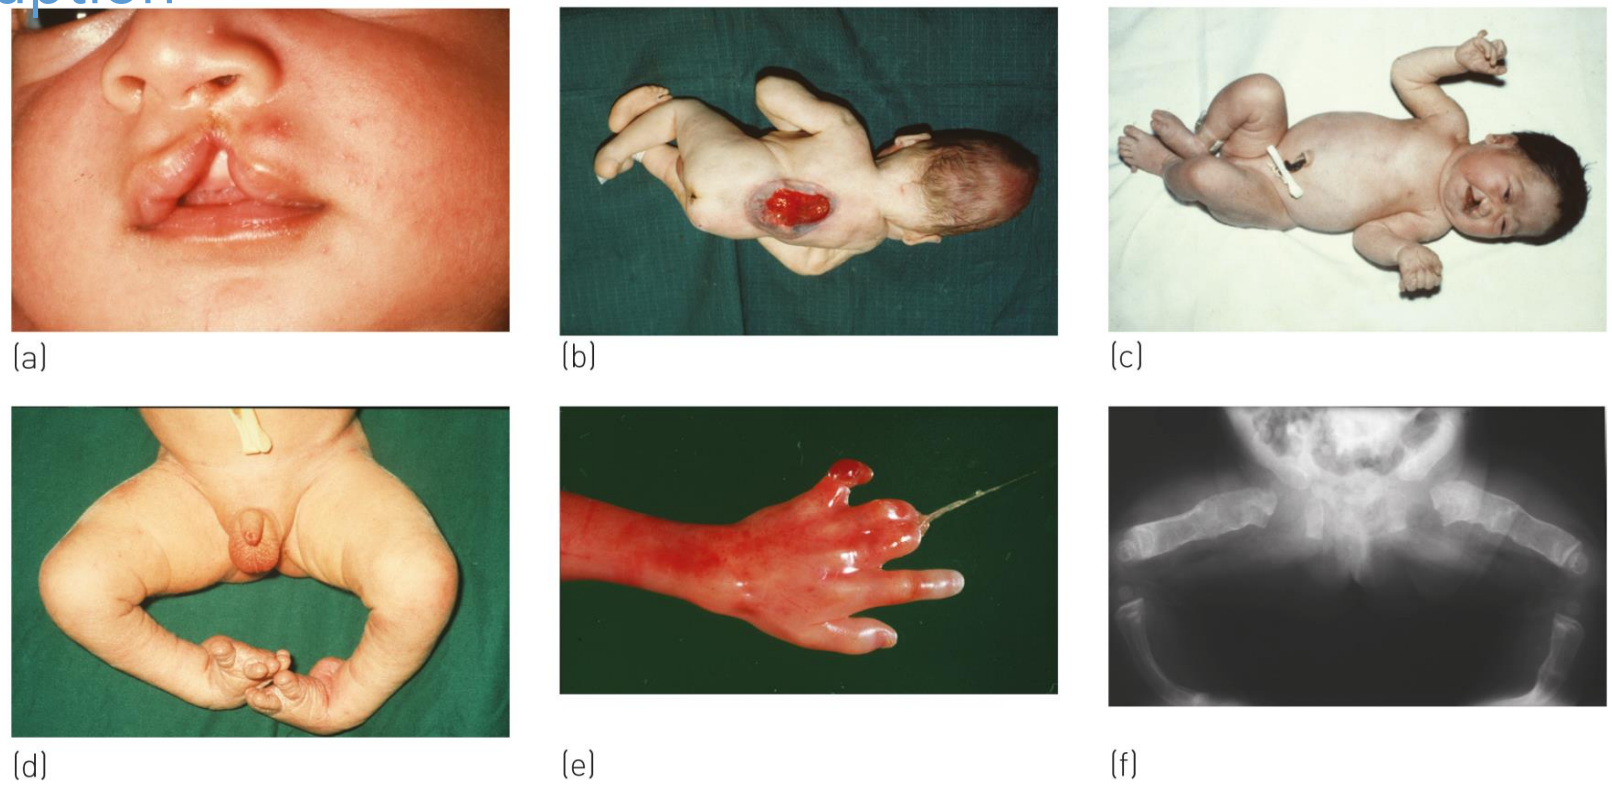
- **Deformation** consequence of extrinsic factors that modify/alter physical devlpt (histology nl)

- **Disruption** destruction of irreplaceable fetal tissue (vascular, trauma, teratogen)

- **Dysplasia** abnormal shape, structure, composition and/ or histology during devlpt ectoderm structure and derivates leading to a wide range of phenotype bone/skelettal

- **Malformation** result from intrinsic abnormalities in one or more genetic program operating during development (e.a polydactyly)

Congenital malformation , sequence, syndrome, deformation, 'disruption'

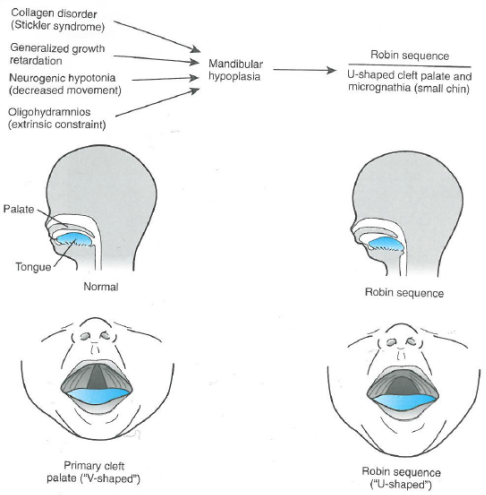


Box figure 14.1 – **Clinical photographs of the main types of dysmorphic features.**
(a) Cleft lip, a **malformation** representing failure of fusion of components of upper lip.
(b) Meningomyelocele, talipes and hydrocephalus, a **malformation sequence** due to failure of closure of the neural tube and consequent effects. (c) Trisomy 13, a baby with a **malformation syndrome** consisting of holoprosencephaly, midline cleft lip and palate, polydactyly and heart defects. (d) Talipes, abnormal position of the feet, a **deformation** due to extreme lack of liquor *in utero*. (e) Amniotic bands, **disruption** of a normal hand by constriction with strands of amnion leading to amputation and secondary fusion of finger tips (syndactyly). (f) Femur bones with multiple fractures and abnormal modeling due to osteogenesis imperfecta, a skeletal **dysplasia**.

Nosology (ct'd)

- **Association**: similar birth defects in different embryologic fields and inability so far to identify a genetic cause 'V.A.T.E.R', 'VACTER', 'VACTERL', cervico auriculo vertebral (coined 'Goldenhar' association)

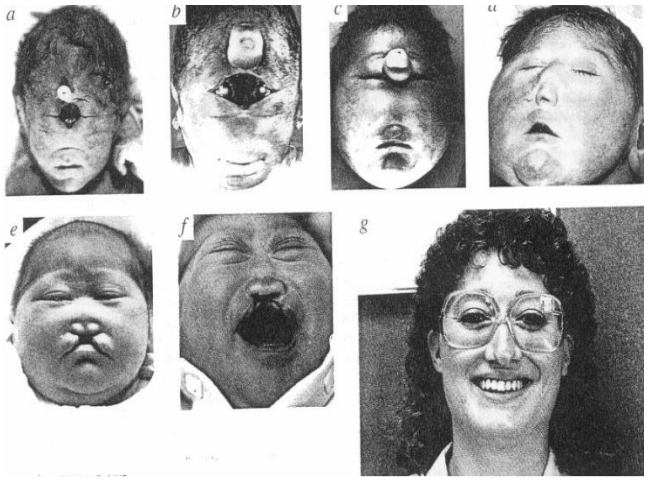
- Sequence: phenotype description of alteration of structures inside an embryonic field during development - *pleiotropic: effect on a single organ/system* - precise moment
NOT a diagnosis ! 'Pierre Robin', Potter',

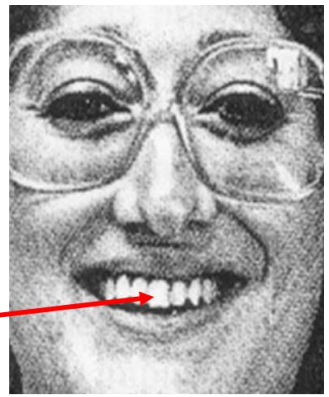


Nosology (ct'd)

- **Syndrome:** combination of birth defects that occur secondarily to cytogenetic and/or a gene anomaly

- **Spectrum**: monogenic or cytogenetic anomaly leading to a modification in a signaling pathway during devlpt - possibly responsible for a wide range of signs that may be overlooked as distinct





Unique Incisor

Holoprosencephaly Sonic Hedgehoc pathway - *SHH; ZIC2; PATCH genes*

Nosologie (ct'd)

- **Association**: malformation congénitale analogue similaire touchant différents territoires embryologiques sans cause identifiée/connue à ce jour
  - exemples: V.A.T.E.R, VACTER, VACTERL

- **Syndrome**: combinaison d'anomalie(s congénitale(s secondaire(s à l'effet pléiotropique : une anomalie chromosomique et/ou génique

Tool III Clinical approach Dysmorphology

David Smith's contribution in 1966

- defines the clinical approach to look for distinct and/or minor signs in a patient to possibly obtain a diagnosis and orientate strategy to complete genotype definition – cytogenetic and/or molecular

- 'dysmorphologist' diagnoses a child with a birth defect, suggests appropriate work-up, guarantees follow-up and integrates pedigree and family history to published clinical reports to basic science literature

Dysmorphologist's 'textbook'

"Elements of Morphology: Standard Terminology"

John C. Carey*
International group of clinicians working in dysmorphology

Aims:

- initiate standardization of terms used to describe human morphology
- reach consensus regarding their definitions
- increase the utility of descriptions of the human phenotype
- facilitate reliable comparisons of findings among patients
- improve discussions with other related workers (pathologists, devlpt biology, molecular genetics) which will become more precise

Dysmorphology 'textbook'

An Introduction to the Human Phenotype Ontology

The Human Phenotype Ontology (HPO) intends to offer a tool that will allow large-scale computational analysis of the human phenome. The HPO currently contains over 11,000 terms, each of which describes an individual phenotypic anomaly. The terms are arranged in a directed acyclic graph and are connected by **is-a** (subclass-of) edges, such that a term represents a more specific or limited instance of its parent term(s). All relationships in the HPO are **is-a**

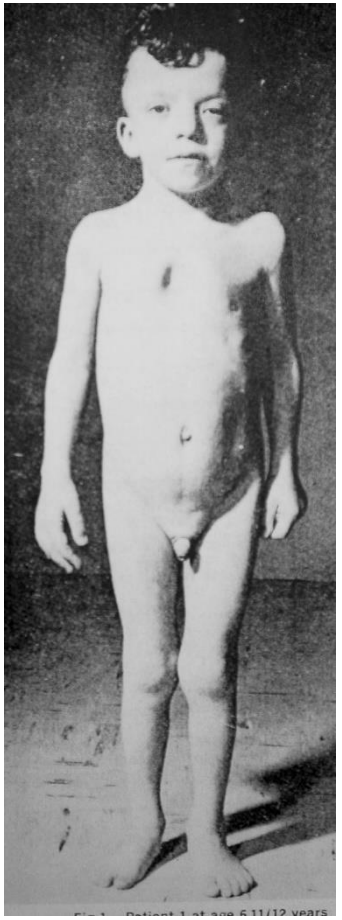
9 patients with pulmonary valve stenosis, short stature
Hypertelorism, mild intellectual disability and ptosis cryptorchidism, ‘skelettal malformations’

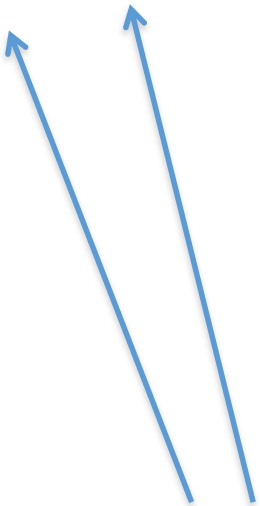


Noonan J and Ehmke D. J Pediatr 1963;63:468-470

Noonan JA. and Lexington K. Am J Dis Child 1968;116:373-380

Variability in phenotype

Large front, hypertelorism; down slanting palpebral fissures,
low set posteriorly rotated ears

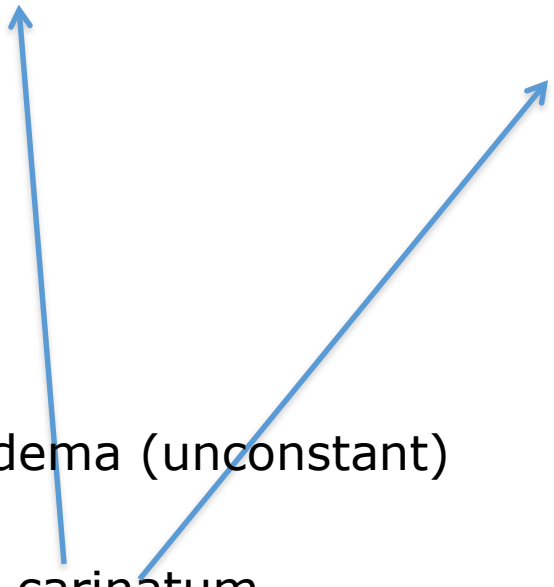


pectus carinatum

Remnant of prenatal nuchal translucency and hygroma

Distinct patient…similar dysmorphic features

Large front, Hypertelorism; down slanting palpebral fissures,low set posteriorly rotated ears



and variable degree of lymphedema (unconstant)

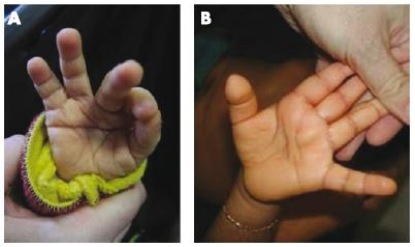
pectus carinatum

…similar phenotypes

Same syndrome…

8 months

4 years



Congenital heart defect « pulm atresia»
IUGR
Hypertelorism
Macrocephaly (relative)
Curly hair
Failure to thrive

...

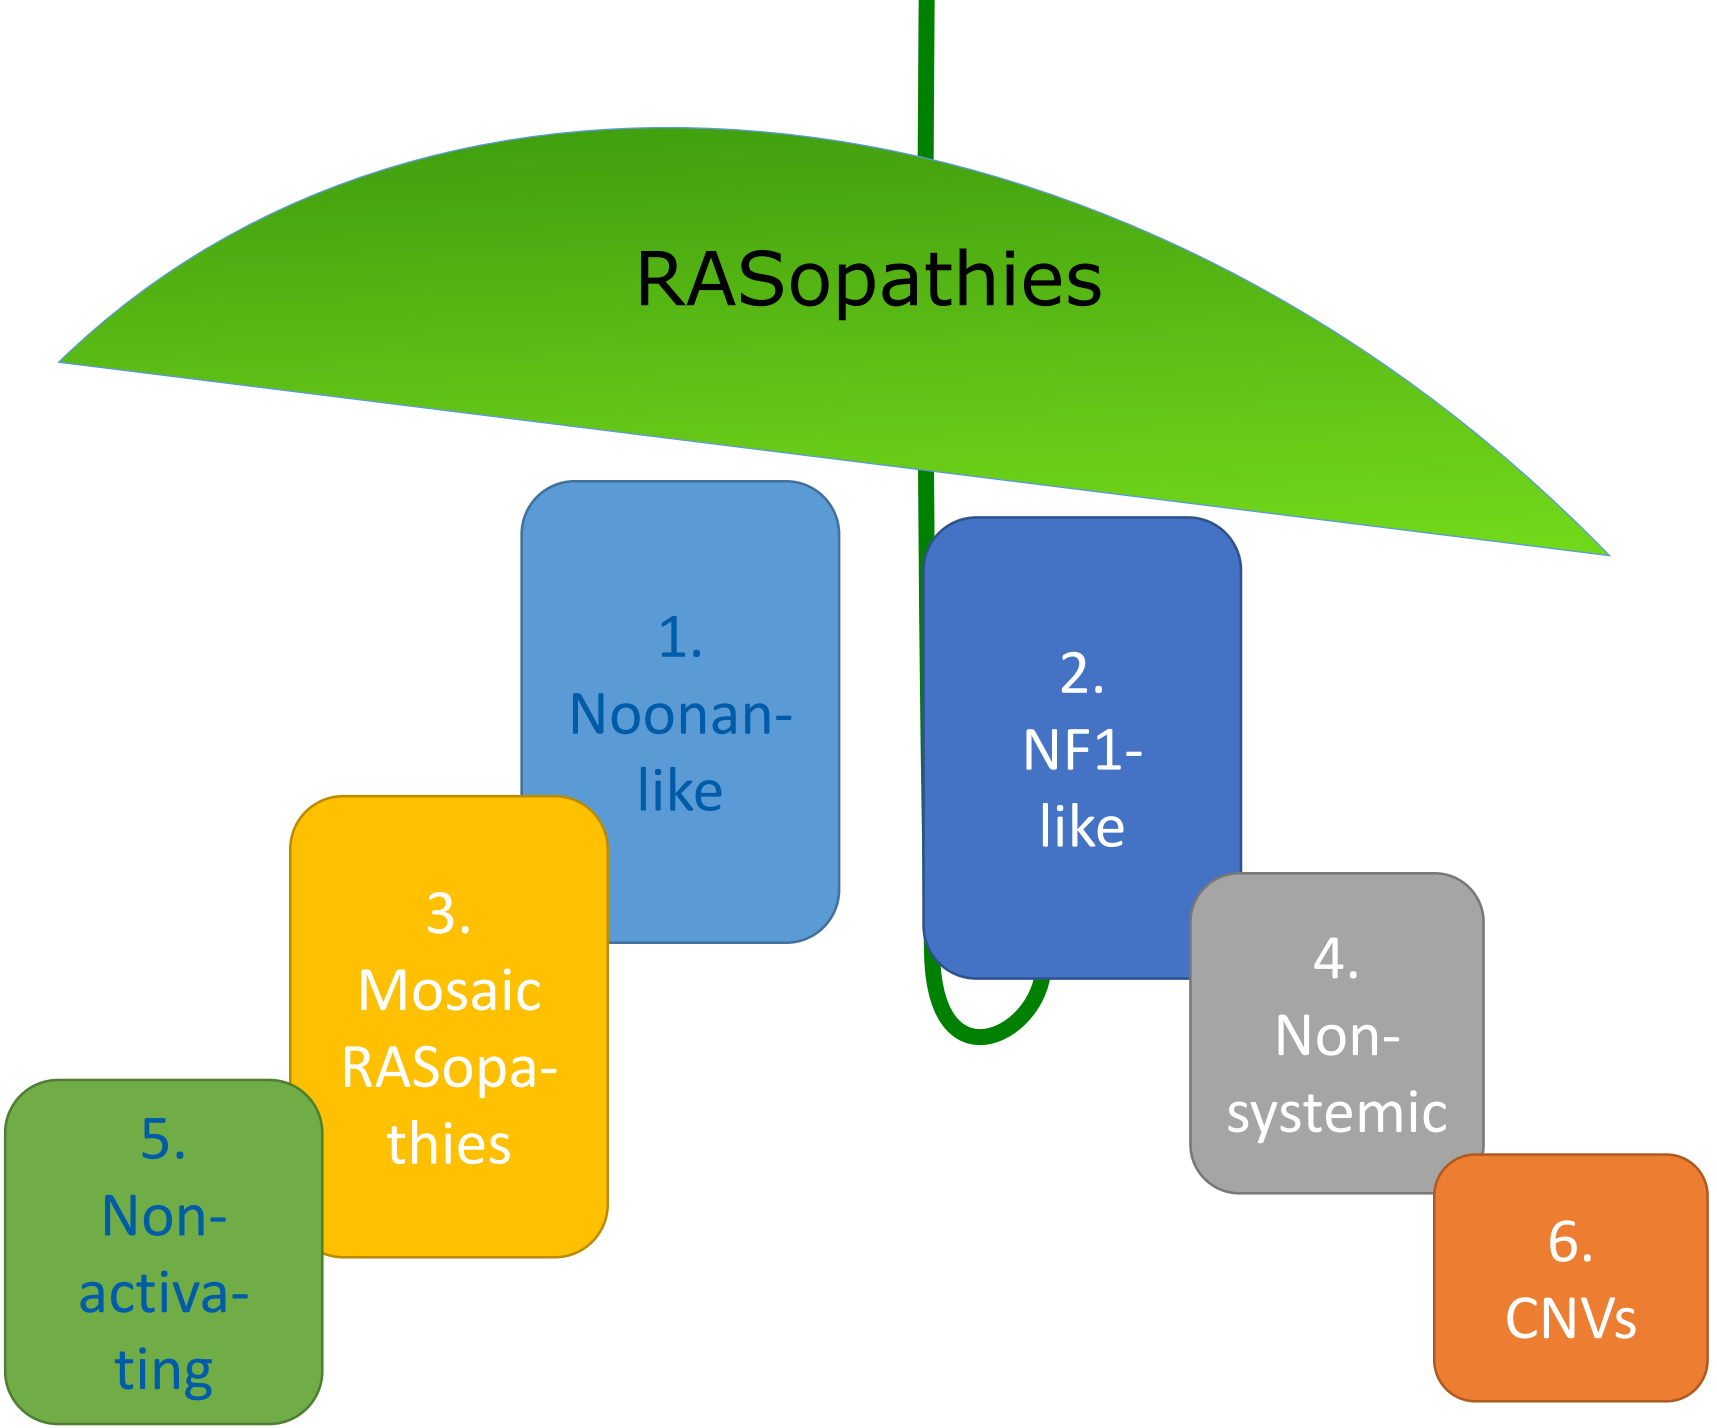
Evolving phenotype with age

...Knowledge on natural history

…to adulthood

…to adult

- Sporadic
- Pulmonary valve stenosis
- Post natal growth retardation
- GH deficiency - therapy



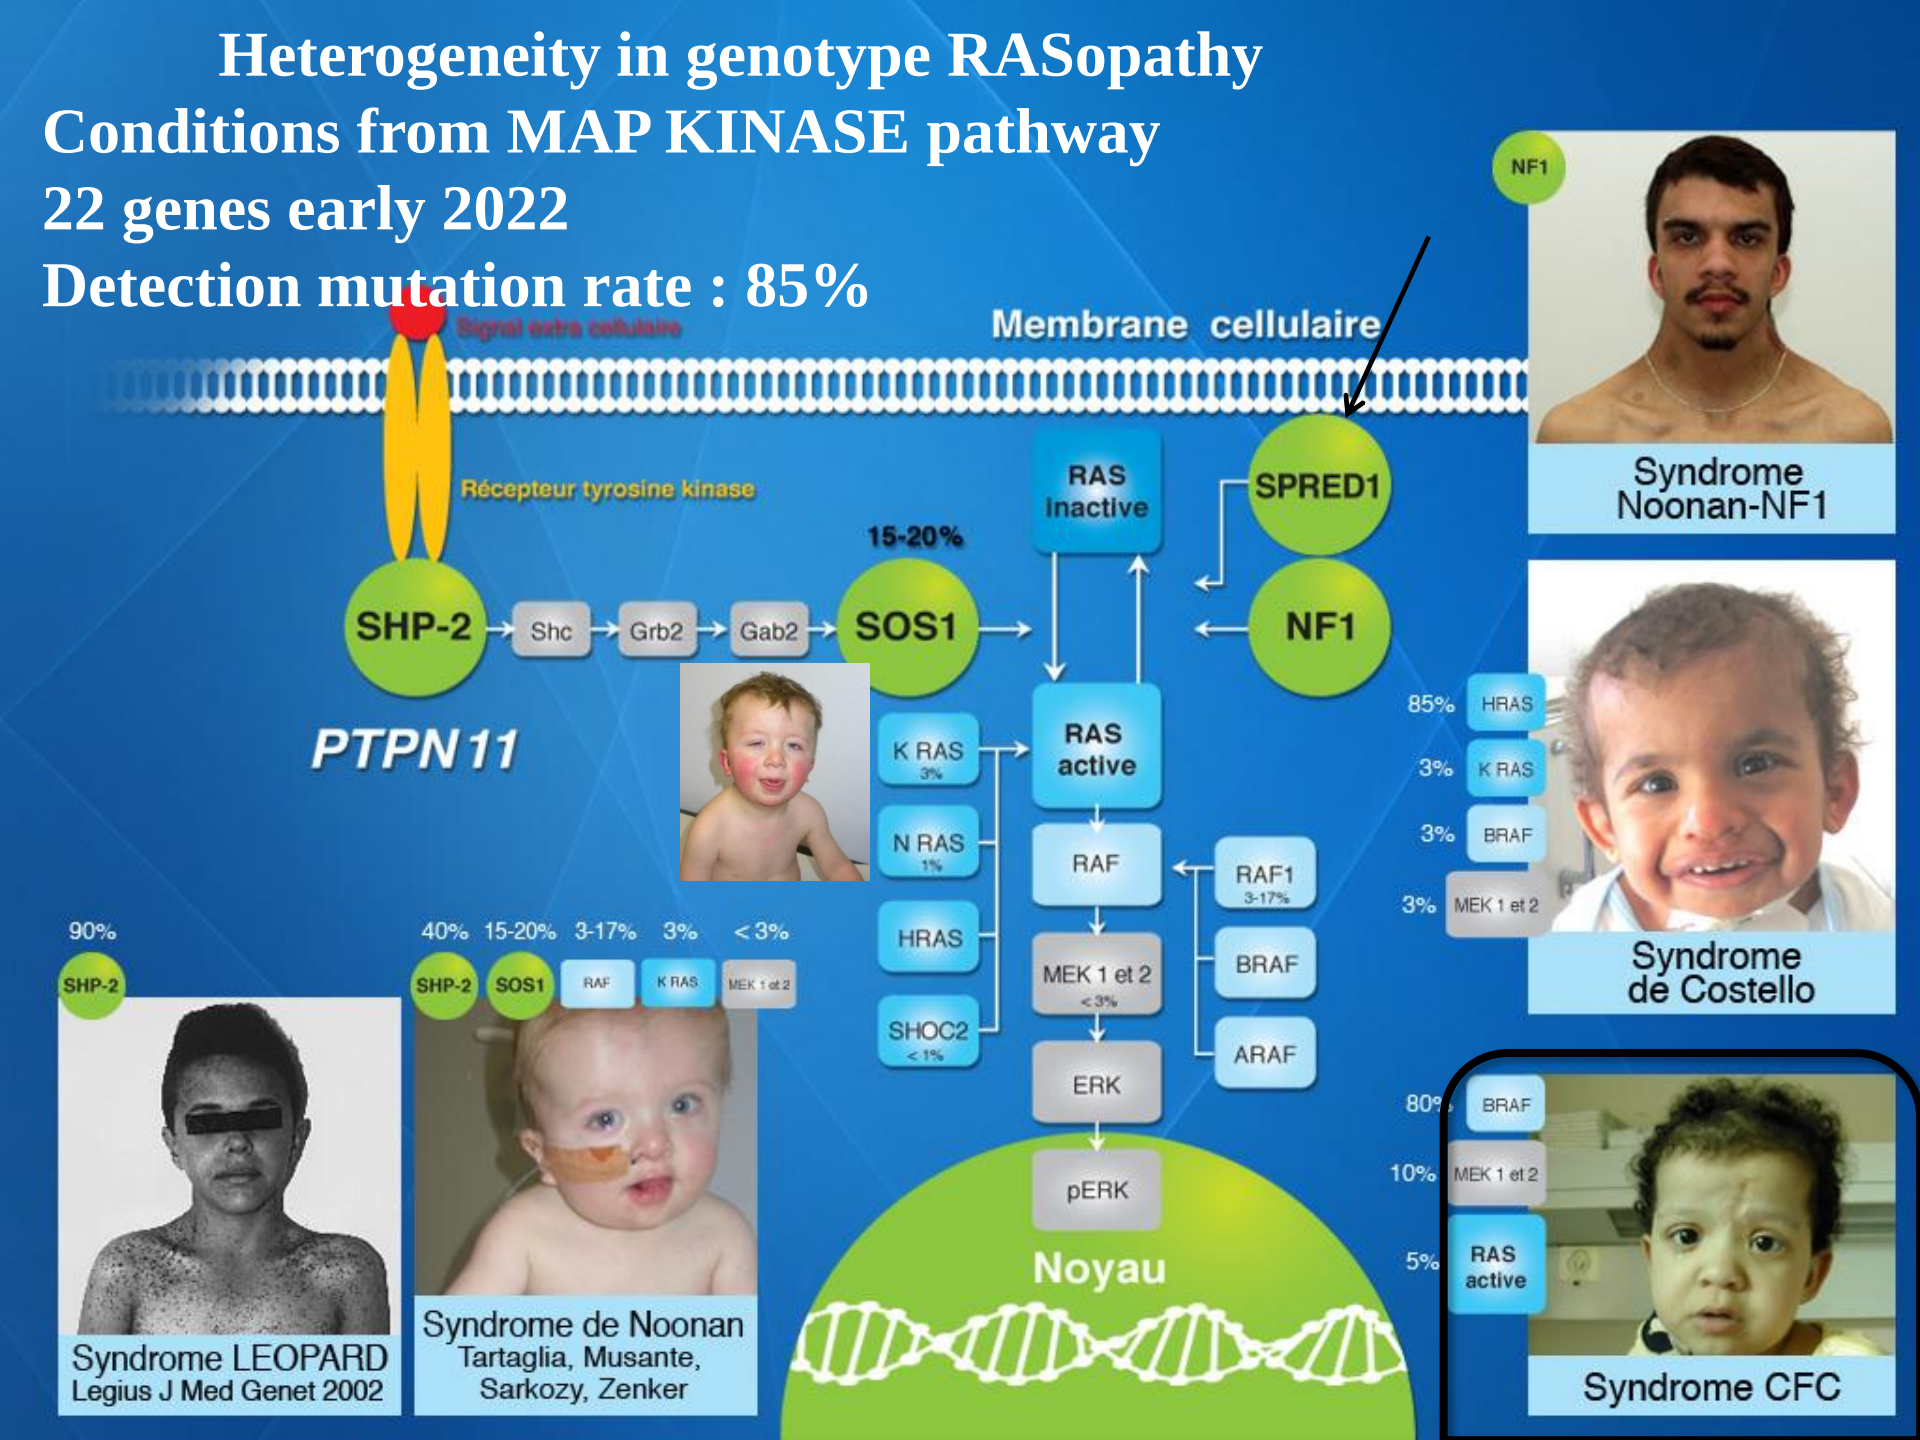
RASopathies
1. Noonan-like
2. NF1-like
3. Mosaic RASopa-thies
4. Non-systemic
5. Non-activa-ting
6. CNVs

Heterogeneity in genotype RASopathy

Conditions from MAP KINASE pathway

22 genes early 2022

Detection mutation rate : 85%



Gene	Highest RASopathy Association Achieved	Specific Conditions				
		Noonan	CFC	Costello	NSML	NS/LAH
BRAF	Definitive	Moderate (10.5)	Definitive (13.5)	Disputed	Limited (5.5)	-
HRAS	Definitive	-	-	Definitive (14.5)	-	-
KRAS	Definitive	Definitive (14)	Strong (12.5)	Disputed	-	-

RASA1	Disputed	Disputed	-	-	-	-

From M. Zenker

Management of Noonan Syndrome

A Clinical Guideline

Noonan Syndrome Guideline Development Group

Recommended baseline investigations in Noonan Syndrome

(where an investigation is not indicated for a specific clinical feature, please refer to the relevant age group-specific page for management recommendations)

Clinical Features of Noonan Syndrome	Baseline investigations
Congenital heart defects (e.g. pulmonary stenosis, hypertrophic cardiomyopathy, atrial septal defect)	Full cardiac evaluation at diagnosis.
Failure to thrive/slow growth rate/feeding problems	Monitor and plot growth on appropriate NS and age-based growth chart.
Short stature	
Developmental delay and neuropsychological/behavioural issues	Refer patient in second half of first year or at diagnosis for formal developmental assessment. Baseline neuropsychological assessment at primary school entry.
Minor renal anomalies	Refer for renal ultrasound at diagnosis.
Bleeding disorders	Carry out baseline coagulation screening in patients aged 5+, or earlier if major procedure to be undertaken. (Prothrombin Time (PT) Activated Partial Thromboplastin Time (aPPT) and FXI assay.)
Visual problems (e.g. posterior segment ocular changes and anterior segment ocular abnormalities)	Refer for specialist ophthalmology assessment at the point of diagnosis.

Remaining questions…

on bench side:

caveats: level of evidence from whole exome sequencing for variants in ‘Rasopathy’

at bedside – genetic counselling Index patient and family

How to explain penetrance ?

How to explain intra familial variable expressivity ?

c.922A>G (p.N308D) ***PTPN11***

Prevalent gene inside RASopathies- 40%

Prevalent mutation – heart defect 60%

Genetic counselling…

in patients with very mild phenotype

‘de novo’ autosomal dominant condition

50% transmission

Variable expressivity

…

access to PGD

Birth defect to genetic counselling

Building evidence since 2020

Clinical Geneticists are far less pertinent then thought
Human Hardware/brain memory on 4.000 mendelian disorders and phenotypes ?

Integrate targeted/non selective NGS gene panel approach / WES

Filtering on variants of unknown significance

When genetics approach become reverse (‘unusual phenotype’), genotype identification …« From Gene to Face » and vice-versa
